

JUAN MONGE

One engineer. The whole system.

I architect it, build it, secure it, and ship it.

8+ years

architecture to operations

≈700 → 150

global Kubernetes fleet

estimated AWS savings

01 The whole system is my scope

I am a hands-on engineering architect with 8+ years of experience taking difficult products from a blank page to secure production.

I do not hand off the hard parts. I define the architecture, build the critical backend and frontend, secure identity and data, automate the infrastructure, and own the release. My scope spans SSO, high-throughput REST and gRPC APIs, React and Next.js, native and cross-platform mobile, cloud platforms, DevOps, security, and production operations.

My edge: I can deliver a complex project independently when speed demands one accountable owner—and lead the team when scale demands more.

02 Give me the outcome

I OWN THE PATH TO PRODUCTION

I turn the business goal into system boundaries, software, infrastructure, security, release automation, and an operating model. The stack serves the result—not the other way around.

01

Architect

SSO and identity, service boundaries, data flows, cloud topology, resilience, capacity, and cost.

02

Build

High-throughput REST/gRPC APIs, FastAPI/Fastify, React/Next.js, PWA, React Native, and Swift.

03

Secure

OWASP Top 10, Vault, access control, secrets, secure delivery patterns, and remediation.

04

Deliver & run

Terraform, CI/CD, serverless, Kubernetes, observability, recovery, incident response, and SRE.

Architecture — Build — Security — Delivery — Operations

03 Experience

2018 – PRESENT

DevOps Manager

Jun 2025 – Present

IBM • Costa Rica • Hybrid

- Own SRE/DevOps delivery for IBM Cloud Backup & Recovery Service, combining people leadership with hands-on accountability for reliability, security, technical execution, and operational readiness.
- Drove the architecture and execution of a demand-aligned global fleet strategy, reducing the planned footprint from approximately **700 Kubernetes clusters to 150** while preserving regional presence.
- Removed duplicated DR, in-region, and high-availability capacity—and the Kafka, Redis, cache, and external licensing attached to it—contributing to **REDACTED estimated savings**.
- Lead incident response, security remediation, production readiness, and the development of a globally distributed engineering team.

Senior DevOps Engineer

Jun 2023 – May 2025

Lakeshore Learning Materials · United States · Remote

- Designed and operated AWS infrastructure using Amazon EKS and Terraform for repeatable provisioning, platform reliability, and production delivery.
- Created an AWS tagging and cost-attribution strategy that made every resource accountable and exposed overprovisioned capacity plus infrastructure retained for initiatives that never launched.
- Converted that visibility into action: right-sized analytics clusters and supporting resources to deliver **REDACTED** **estimated annual cloud savings.**
- Moved self-managed PostgreSQL infrastructure to managed PostgreSQL services, cutting operational burden and producing additional recurring database savings.

DevOps Lead

Feb 2022 – Jun 2023

Accenture · Remote

- Led and mentored DevOps engineers while serving as a technical consultant across cloud infrastructure and delivery initiatives.
- Guided planning and technical direction across AWS, Docker, infrastructure as code, automation, and DevOps delivery.

Senior DevOps Cloud

Mar 2021 – Feb 2022

Accenture · Remote

- Delivered cloud and DevOps solutions using Docker, CI/CD, infrastructure as code, solution architecture, monitoring, Python, and Terraform.
- Provided technical consulting and production-focused engineering across cloud environments.

ENGINEERING FOUNDATION

2019 – 2021

DevOps Engineer – Mobile CoE · 3M

DevOps, application publishing, development, and Python automation for the global Mobile Center of Excellence.

2019

Platform Engineer · Dell EMC

Enterprise scale-out NAS infrastructure for big-data solutions using Linux and Python.

2019

Mobile Developer · ICAP

Self-managed design and architecture of a Xamarin Forms app for Android and iOS, backed by .NET Core REST APIs and PostgreSQL.

2018

Software Developer Intern · Grant Thornton

Web BPM platform with CRM and BI modules, KPI integration, and monthly management reporting.

04 Architecture that pays for itself

TECHNICAL DECISIONS · BUSINESS RESULTS

I measure architecture by what it changes: less waste, lower risk, faster delivery, and every critical capability still intact.

IBM · GLOBAL PLATFORM

Global capacity—without global waste

REDACTED
ESTIMATED SAVINGS · CONFIDENTIAL

Replaced broad, duplicated DR/HA/in-region capacity with granular deployment decisions based on actual demand. Global regional presence remained intact while the cluster estate—and its Kafka, Redis, cache, and external licensing costs—contracted dramatically.

~79% smaller cluster footprint **Global** regional coverage preserved

LAKESHORE · AWS FINOPS

Make cost visible. Remove the waste.

REDACTED
ESTIMATED ANNUAL SAVINGS · CONFIDENTIAL

Made ownership and cost visible through tagging, found oversized and abandoned project resources, and rebuilt analytics capacity around real demand. Then moved self-managed PostgreSQL to managed services for additional recurring savings and lower operational load.

AWS tagging-led visibility **Managed DB** less operational overhead
